Ensuring Data Consistency, Integrity, Availability, and Transparency

Data Governance

Companies often have problems with unrepresentative or inconsistent data, causing them to lose trust in their reporting and business insights. However, these issues may have dozens of potential causes, making the process highly complicated to resolve.

Enter data governance. We see a number of ingrained problems that data governance can solve:

- The data seems "off" somehow or incorrect

- Different reports have different numbers or conclusions

- Reporting is piecemeal, with data in various formats, perhaps from various locations

- Low standards for reports lead to documents that are frequently tardy and poor-quality, or multiple superfluous reports stored across the enterprise

Without a well-considered plan for data governance, your business can easily fall victim to catastrophes such as breaches and data loss in addition to general inefficiency.

Unlocking the Business Benefits of Data Governance

Datavail's team of data governance experts can handle these challenges for you. The benefits of data governance include:

- **Decision-making**: Having access to the latest information makes it easier for you to make smart, data-driven decisions.

- **Efficiency**: Employees no longer have to worry about data governance tasks outside of their core competencies.

- **Compliance**: Strong data governance policies make it easier to establish a paper trail in the event of an audit.

At Datavail, we offer data governance services that fit the needs of any company struggling to get a handle on its information. Our strategy has six crucial steps:

Assist: Help each department within your company plan and develop its own goals for the future.

Develop: Create best practices and guiding principles tailored to your organization's needs.

Streamline: Reorganize data sharing and reporting within a single master data management channel.

Profile: Forensically assess sample data from different data sets to ensure that the information is accurate and high-quality.

Analyze: Interpret results and, if necessary, customize data governance rules and processes.

Recover: Find and recover data-related issues, from crashes to performance issues.
