

Cloud-based Automation Platform for Databases

Datavail TechBoost™

Datavail TechBoost™ builds upon the foundation that Datavail Delta established. This robust cloud-based automation platform solution takes the extensive experience and hands-on knowledge that our DBAs have and distills it into a powerful cloud-based database automation platform that tracks 500+ customizable metrics and operates 24x7x365. Datavail TechBoost™ empowers your organization by improving the availability, reliability, and performance of your databases through fast issue identification and resolution.

Features and Benefits

24x7x365 Database Automation

You expect your databases to be available at all times. Your database solution should be too. Datavail TechBoost™ operates and connects with our experienced DBAs to provide you with world-class support whenever you need it.

500 Tracked Metrics

The most important database metrics can vary significantly between servers. You have the ability to track 500 metrics. If Windows or Linux gives you information on it, Datavail TechBoost™ can keep an eye on it. Fully customize your database experience so you have access to the data that matters most.

Cloud-based Database Automation Infrastructure

Setting up your own database automation infrastructure requires a massive resource investment. You can eliminate these upfront expenses by leveraging our cloud-based solution that will continually update with new functionality.

Speed Up Time to Resolution of Database Issues

Datavail TechBoost™ alerts are sent out in real-time, allowing your DBA team to quickly receive this information. Its Root Cause Engine (RCE) automates determination of root cause and speeds resolution time. Additionally, a ticket is automatically created and assigned to further streamline the process. Every second counts when database performance is not at 100 percent, and this solution saves significant time.

Lower DBA Opportunity Cost

Your DBA resources can be better allocated by removing the need to perform time-consuming and repetitive monitoring tasks. This automated database monitoring application allows DBAs to focus on proactive and strategic measures to optimize database performance and provide other valuable services.

Lightweight Application

Datavail TechBoost™ only uses a minimal amount of storage and compute power. Its lightweight footprint allows it to provide powerful monitoring and automation tools without impacting other important services. It also allows this solution to work on a broad range of servers, no matter what type of resource constraints you're facing.

Broad Database Support

Datavail TechBoost™ supports many types of databases: SQL Server, Amazon RDS for SQL Server, Oracle, MySQL, and PostgreSQL are currently supported. Along with, Amazon Aurora for MySQL and Postgres. Both Windows and Linux OS are supported, too! Our product is constantly taking on new technologies and growing. We have a Client Portal in the works, as well as Azure support coming soon. You can use a single, automated solution for all your databases rather than using vendor-specific options.

Datavail TechBoost™ is currently helping more than 400 customers monitor 400,000 databases and resolve 2 million incidents. Contact us today to experience these cloud-based database automated benefits firsthand and to learn more about our database services.
